HOPE AI ASSIGNMENT - REGRESSION Tabulation of R-Square values

GitHub Link for dataset:

https://github.com/JayachandraPrabha/Assignment-Regression/blob/main/insurance_pre.csv

Problem Statement / Requirement:

A client's requirement is, he wants to predict the insurance charges based on several parameters. The Client has provided the dataset of the same.

As a data scientist, you must develop a model which will predict the insurance charges.

- 1.) Identify your problem statement
- 2.) Tell basic info about the dataset (Total number of rows, columns)
- 3.) Mention the pre-processing method if you're doing any (like converting string to number–nominal data)
- 4.) Develop a good model with r2_score. You can use any machine learning algorithm, You can create many models. Finally, you have to come up with the final model.
- 5.) All the research values (r2_score of the models) should be documented. (You can make a tabulation or screenshot of the results.)
- 6.) Mention your final model, justify why you have chosen the same.

Tabulation of all the research values (r2_score of the models):

- 1. Multiple Linear Regression(MLR) → R-Square value: 0.7978644236809904
- 2. Support Vector Machine (SVM) → R-Square value: 0.8631863171770662

| S.No | С | kernel | | | |

| 32 | | 100 | 0.8923 |

Conclusion:

The finalized model is **Random Forest**.

After analyzing with various algorithms & with its hyper/tuning parameters whose r-square values (r2_score) were as follows:

| S.No | Algorithm | R-square value(r2_score) | Model output |
|------|---------------------------------|--------------------------|--------------|
| 1 | Multiple Linear Regression(MLR) | 0.7978644236809904 | Poor |
| 2 | Support Vector Machine (SVM) | 0.8631863171770662 | Moderate |
| 3 | Decision Tree (DT) | 0.7971644236809041 | Poor |
| 4 | Random Forest (RF) | 0.8953409033050059 | Good |

Conclusion:

In conclusion, the best model obtained is **Random Forest**.

The random forest algorithm provided the r-square value (r2_score*) is 0.8953 (nearly 90% of the accuracy). Hence Random Forest algorithm is finalized as the best model.

*(r2_score i.e., The obtained r-square value nearing 0 \rightarrow Poor model & the value 1 nearing 1 \rightarrow Good model)
